

SMARTRETAIL CHAIN DASHBOARD

Item	Detail
Data source:	DUA Edu — SmartRetail Chain Dashboard (Power BI Service)
Scope:	4 dashboard pages: Executive Overview, Sales Performance, Products Analysis, Operation & Service
Report date:	September 30, 2026

1. Context & Scope of Analysis

The dashboard is filtered to Year 2026, Month 6 (June). The 'vs. Last Period' figures on all 4 pages compare June with May 2026 (month-over-month), not year-over-year. The January to June 2026 trend charts are used to assess whether the June movement is a one-off shock or an emerging trend.

Revenue in this dashboard counts Completed orders only; Cancelled orders are excluded. Regions (North, South, Central) are as defined in the dataset.

Data coverage: The dataset ends on 25 June 2026, so June contains 25 days of orders while May contains 31. The dashboard's month-over-month figures therefore compare a partial month with a full month, which overstates every decline (for example –18.7% revenue). To avoid this, this report compares June 1–25 with May 1–25 ("like-for-like") for revenue, orders, segments, stores, channels, regions and products. Completion rates and ratings are ratios and are much less affected; the dashboard's full-May values are quoted alongside where they differ. The figures (screenshots) show the dashboard's full-May comparison.

2. Business Insights & Recommended Actions

The 6 insights below were derived by cross-referencing data across all 4 dashboard pages, applying the What / So What / Now What framework. All changes are like-for-like (June 1–25 vs May 1–25) unless marked as dashboard values.

Insight 1 (Overview): The –18.7% headline is a partial-month effect; revenue per day is stable in June and profit margin holds steady

What: The dashboard shows June revenue of €247.68K, down 18.7% from €304.70K in May, but June has only 25 days of data against 31 in May. Like-for-like (1–25 May: €231.83K), June revenue is up 6.8%, and revenue per day is flat (€9.83K in May, €9.91K in June). The earlier decline is real: revenue per day fell from €13.24K in February to €9.83K in May (Mar €11.78K, Apr €11.27K), then stabilised in June. Net profit margin stayed between 18.0% and 18.3% from January to June (June: €45.22K, 18.3%).

So what: Costs move in line with revenue (cost of sales is about 81.6% of revenue), so there is no margin erosion. The data has no fixed costs, so it cannot show whether the cost structure is efficient. The dashboard's "fourth consecutive monthly decline" should not be read as a June collapse, because June is compared as a partial month. Like-for-like, placed orders rose 8.3% (204 → 221), completed orders fell 1.9% (161 → 158), the completion rate fell 7.4 points (78.9% → 71.5%; dashboard vs full May: 79.6% → 71.5%, –10.2% in relative terms) and average order value rose 8.9%. Together: $1.083 \times 0.906 \times 1.089 \approx 1.068$, which is the +6.8%. Demand (orders placed) is holding; the weakness is that fewer placed orders are being completed.

Now what: (1) Change the dashboard's variance measures to compare equal day ranges (or revenue per day) while the current month is incomplete, and set an alert for two consecutive months of decline in revenue per day. (2) Focus the investigation on the completion-rate issue in Insight 5, and keep tracking demand drivers (seasonality, competitors, marketing), because revenue per day is still about 25% below its February level.

Figure 1: Executive Overview, June 2026 vs May 2026 (KPIs, revenue by region, revenue and net profit trend). Dashboard values compare June 1–25 with the full month of May.

Insight 2 (Sales Performance): Completed orders are flat and order value is up; Student, Business, Premium and VIP fell while Office Worker and Regular grew

What: Like-for-like, completed orders fell 1.9% (161 → 158) while average order value rose 8.9% (€1.44K → €1.57K), so revenue rose 6.8%. (Dashboard vs full May: 207 → 158 completed orders, -23.67%, and AOV +6.49%; the order decline is inflated by the partial month.) By customer segment (Table 1, calculated from the dataset), Student, Business, Premium and VIP fell, while Office Worker and Regular grew strongly.

Table 1: Revenue by customer segment, June 1–25 vs May 1–25, 2026

Segment	May 1–25 (€K)	June 1–25 (€K)	Change	Change (€K)	Share of June
Student	81.5	62.7	-23.1%	-18.8	25.3%
Business	28.5	19.7	-30.8%	-8.8	8.0%
Premium	15.2	9.5	-37.7%	-5.7	3.8%
VIP	5.3	1.9	-63.3%	-3.4	0.8%
Office Worker	73.1	103.0	+40.9%	+29.9	41.6%
Regular	28.2	50.8	+80.3%	+22.6	20.5%

So what: The segment picture is mixed rather than a broad decline: Office Worker and Regular added €52.5K, while Student, Business, Premium and VIP lost €36.7K in total. Student is the largest loss in euros (-€18.8K). Business, Premium and VIP fell 31–63% but together are only 12.6% of June revenue, so small numbers swing the percentages easily. Completion rates also fell for Student (76.5% → 64.5%), Premium (88.9% → 57.1%) and VIP (80.0% → 50.0%); the last two rest on very few orders.

Now what: Do not launch a broad win-back campaign on this evidence. Monitor Student and Business/Premium/VIP revenue and completion rate through July on a like-for-like basis, and test

win-back offers only if the decline persists. Add a customer-segment view to the dashboard so the trend can be tracked.

Figure 2: Sales Performance KPIs, June 2026 vs May 2026 (dashboard values, June 1–25 vs full May).

Insight 3 (Sales Performance): Amazon gains while Website and Otto lose; Frankfurt and München Mitte fall while Berlin Mitte grows in revenue

What: Like-for-like, revenue rose in Online Hub (+49.4%, +€19.7K), München Ost (+36.9%, +€12.5K) and Berlin Mitte (+22.6%, +€9.1K), and fell in Frankfurt Store (–23.2%, –€14.2K) and München Mitte (–19.8%, –€11.2K) (Figure 3; the dashboard's full-May comparison shows larger declines of –37.6% and –32.5%).

By channel, chain-wide: Amazon +85.7% (€38.6K → €71.8K), Offline Store +3.6%, Ebay –9.6%, Otto –8.4% and Website –22.8%. In the three stores of Table 2, Website and Otto lost €25.5K together while Amazon gained €18.1K, and Ebay swings sharply between stores (Frankfurt –€17.1K, München Mitte +€11.0K).

Table 2: Revenue change by store and sales channel, June 1–25 vs May 1–25, 2026

Channel	Berlin Mitte	Frankfurt Store	München Mitte	Three stores
Website	–€1.9K (–29.2%)	–€1.2K (–10.5%)	–€10.2K (–72.6%)	–€13.3K
Otto	+€1.9K (+29.8%)	–€7.3K (–49.2%)	–€6.8K (–51.7%)	–€12.3K
Ebay	+€1.7K (+19.3%)	–€17.1K (–85.9%)	+€11.0K (+186.6%)	–€4.3K
Offline Store	–€1.6K (–16.8%)	+€1.0K (+12.4%)	–€4.1K (–27.0%)	–€4.7K
Amazon	+€8.9K (+100.0%)	+€10.4K (+155.1%)	–€1.2K (–14.2%)	+€18.1K
Total	+€9.1K (+22.6%)	–€14.2K (–23.2%)	–€11.2K (–19.8%)	–€16.4K

Store-level operational signals:

- Berlin Mitte: revenue rose (+22.6%, driven by Amazon +€8.9K), but the completion rate fell from 85.3% to 68.1% (–17.2 pts, the largest drop in the chain; Frankfurt –14.6 pts, München Mitte –6.4 pts) and its June average rating of 2.59 is the lowest in the chain. Website and Offline Store revenue each fell as completed orders went from 7 to 5.
- Frankfurt Store: the Ebay channel lost €17.1K (–85.9%), the largest single store-channel loss. Placed Ebay orders fell from 13 to 7, and only 3 of the 7 were completed (11 completed orders in the same 25 days of May). Otto also fell 49.2% (–€7.3K).

Each store-channel combination contains only 3 to 11 completed orders in each period, so single channel percentages are signals, not conclusions.

So what: The pattern is channel-level rather than city-level: Website falls in all three stores and Otto in two of them, while Amazon grows in two of three. This suggests channel- or process-level causes (checkout, order handling, stock synchronisation, cancellations) rather than weak demand in one city. Since revenue only counts Completed orders, every additional cancelled order reduces revenue directly. Frankfurt Store is the clearest problem in euros. Berlin Mitte shows the sharpest fall in completion rate and the lowest rating even though its revenue grew,

which makes it the clearest operational warning. The causes are hypotheses for an audit, because the dataset has no cancellation-reason field.

Now what: (1) Frankfurt Store: review the Ebay channel, in particular why placed orders fell from 13 to 7 and why 4 of 7 were not completed. (2) Berlin Mitte: audit the completion rate, the reasons behind the 2.59 rating and Offline Store stock availability. (3) Website and Otto in all stores: check checkout errors, listing and stock synchronisation, and cancellation reasons. (4) Add a store × channel completion-rate view to the Operations page.

Figure 3: Revenue by store and detailed revenue by store and sales channel (Berlin Mitte shown). Dashboard values: June 1–25 vs full May.

Insight 4 (Product Analysis): Apple and the MacBook Air M3 fall while smartphones grow; revenue is still highly concentrated

What: Apple generated 62.08% of June revenue, down from 68.5% in the same 25 days of May. Its revenue fell 3.2% like-for-like (€158.8K → €153.7K; dashboard vs full May: –25.0%), while Dell (+44.2%) and Samsung (+21.2%) grew. The main negative is the MacBook Air M3, the top-selling product in both periods: revenue fell 19.0% like-for-like (€69.2K → €56.0K; dashboard: –44.0%). At an unchanged price of €1,099, units sold fell from 63 to 51 (2.5 → 2.0 per day) and placed orders from 29 to 21. The MacBook cancellation rate in June (23.8%) is within the March–May range (18.9–29.3%), so the drop comes mainly from fewer orders placed (Figure 4).

By category, Smartphone grew 22.5% (iPhone 15 +23.2%, €44.8K → €55.2K; Galaxy S24 +21.2%), Monitor 11.8% and Accessory 2.9%, while Tablet fell 8.3%. Laptop was flat (+1.3%) because Dell Inspiron (+44.2%) offset the MacBook decline.

So what: Revenue still depends heavily on one brand and one product: Apple is 62% of revenue and MacBook Air M3 alone is 22.6%, although both shares are lower than in May. A top-selling position does not guarantee stable sales. Because the price did not change, the cause of the MacBook decline is more likely demand or availability (stock, competitor offers, a new model) than pricing. Growth in Smartphone and Dell is already reducing the dependence on Apple.

Now what: (1) Investigate the MacBook Air M3 decline: stock availability in June, competitor and new-model effects, marketing activity. (2) Keep growing the Smartphone category (both iPhone 15 and Galaxy S24 are growing) to reduce the reliance on Apple, and check why the iPhone 15 completion rate fell from 75.8% to 61.4%.

Figure 4: Revenue by brand and detailed revenue by brand. Dashboard values: June 1–25 vs full May.

Insight 5 (Operations): Completed Order Rate drops sharply in June, mostly at physical stores and on Website and Otto

What: The completed order rate fell to 71.49% in June, from 79.62% in the full month of May (−8.1 points, −10.2% in relative terms; 78.9% in 1–25 May, −7.4 points), after five months between 78.2% and 81.7% (Figure 5). Because this is a ratio, it is much less affected by the partial month than revenue or order counts. By store (like-for-like), the largest drops were Berlin Mitte (−17.2 pts), Frankfurt Store (−14.6 pts), München Ost (−8.6 pts) and München Mitte (−6.4 pts), while Online Hub improved (+8.0 pts). By channel, Website fell 17.9 pts (83.7% → 65.8%) and Otto 12.6 pts (83.7% → 71.1%), against −5.6 pts for Offline Store, −4.0 pts for Amazon and +0.4 pts for Ebay.

The average rating rose to 3.15 (+8.5% vs the full-May 2.90; 2.84 in 1–25 May), but May was the lowest month of the year and January to April ranged from 3.01 to 3.13, so June is a return to normal rather than a clear improvement.

So what: The lower completion rate is the clearest problem in June. Had June kept the completion rate of 1–25 May (78.9%), about 16 more orders (roughly €26K at €1.57K per order, about 10% of June revenue) would have been completed. Ratings exist only for completed orders, so they cannot rule out fulfilment or service problems for cancelled orders. Because Online Hub improved, the problem sits mainly in the four physical stores and in the Website and Otto channels. The dataset has no cancellation-reason field, so causes still need to be confirmed.

Now what: (1) Investigate cancellations at the four physical stores and on Website and Otto: stock availability, order processing errors and delivery delays. (2) Track the completion rate weekly by store and channel, and record a cancellation reason. (3) Target a completion rate of at least 78%, the level seen from January to May.

Figure 5: Operation & Service KPIs and completion rate trend, June 2026 vs May 2026 (dashboard values).

Insight 6 (Overview): Central is the only region that declined; revenue is not dependent on one or two regions

What: June revenue was split across North (€92.38K, 37.3%), South (€91.79K, 37.1%) and Central (€63.51K, 25.6%) (Figure 6). Like-for-like, Central fell 21.4% (−€17.3K), while North rose 16.2% (+€12.9K) and South 28.4% (+€20.3K); the dashboard's full-May comparison overstates the declines (Central −37.0%, North −8.6%, South −10.7%). Net profit margin is similar across regions (North 18.0%, South 18.0%, Central 18.9%).

So what: Revenue is spread across three regions, so there is no single-region concentration risk. Central is the only region that lost revenue and also has the largest completion-rate drop (85.2% → 68.1%, -17.2 pts, versus -1.2 pts in North and -5.3 pts in South). Regions are as defined in the dataset, and Central covers the cities Dresden, Erfurt, Frankfurt am Main, Hannover and Kiel.

Now what: Investigate Central's cities for stock, order-handling and demand issues. Add a % Revenue Variance column (on an equal-day basis) to the "Detailed revenue by Region" table so the regional trend is visible on the dashboard.

Figure 6: Revenue by region and detailed revenue by region, June 2026

3. Priority Action Plan Summary

Owners and targets are proposals to be confirmed with the business.

No.	Related Insight	Key Action	Priority	Timeline	Owner	KPI / Target
1	Data basis (1)	Compare equal day ranges (or revenue per day) while a month is incomplete; alert when revenue per day falls 2 months in a row or the completion rate drops below 76%	High	Immediately	BI Analyst	Alert live; no partial-vs-full-month comparisons
2	Completion rate (5)	Investigate cancellations at the four physical stores and on Website and Otto; track the completion rate weekly by store and channel	High	1–2 weeks	Operations Manager	Completed Order Rate ≥ 78% within 4 weeks
3	Frankfurt & Berlin Mitte (3)	Review Frankfurt's Ebay channel (11 → 3 completed orders) and Berlin Mitte's completion rate and 2.59 rating	High	1–2 weeks	Store / Regional Manager	Berlin Mitte rating ≥ 3.0; Frankfurt completion rate ≥ 78%
4	MacBook Air M3 (4)	Check June stock availability, cancellations, competitor and new-model effects (price unchanged at €1,099)	Medium	1–2 weeks	Product Manager	Units per day ≥ 2.5 (Jan–May average ≈ 3.0; June 2.0)
5	Customer segments (2)	Monitor Student and Business/Premium/VIP through July; test win-back offers if the decline persists	Medium	2–4 weeks	Marketing Manager	Segment revenue back to May 1–25 level
6	Central region (6)	Investigate Central cities (Dresden, Erfurt, Frankfurt am Main, Hannover, Kiel)	Medium	2–4 weeks	Regional Manager	Central completion rate ≥ 78%
7	Product mix (4)	Grow the Smartphone category (Galaxy S24, iPhone 15) to reduce reliance on Apple/MacBook	Medium	1–2 quarters	Category Manager	Apple share of revenue < 55%

4. Conclusion

The dashboard's headline of an 18.7% revenue decline in June 2026 (the fourth consecutive monthly decline) compares 25 days of June with the full month of May. Like-for-like, June revenue is up 6.8%, revenue per day is flat at about €9.9K, and net profit margin held at about 18%. Revenue per day did fall about 25% between February and May, so the earlier decline is real, but it stabilised in June.

Two priorities need action: (1) the completion rate, which fell to 71.5% from a 78–82% range and dropped most at Berlin Mitte and Frankfurt Store and on the Website and Otto channels (worth about €26K of June revenue), and (2) the MacBook Air M3, whose revenue and units fell about 19% like-for-like at an unchanged price. Central is the only region with lower revenue (–21.4%) and also has the largest completion-rate drop.

In the medium term, revenue should be less dependent on Apple (62% of revenue) by growing the Smartphone category, which is already growing (+22.5% like-for-like). The dashboard's variance measures should also compare equal day ranges, so that partial months do not produce false declines.

5. Limitations

- The dataset is fictional (DUA Edu course exercise). June contains only 25 days of orders (to 25 June) while May has 31, so the dashboard's month-over-month figures overstate declines; this report uses June 1–25 vs May 1–25 for revenue and order counts.
- The like-for-like windows are only 25 days long. Store-channel and segment figures rest on small order counts (3 to 11 completed orders per store-channel), so they are signals, not conclusions.
- The dataset has no cancellation-reason field, no fixed costs and no competitor or stock data; the causes named above are hypotheses to be tested.
- Like-for-like segment, store, region and product variance figures were calculated from the dataset and are not shown on the dashboard, which uses the full-May comparison.
